Date: May 15, 2024

Subject: Push to Connect Aspirator

As part of our continual product improvement initiatives, we are changing the way the water softener brine line attaches to the aspirator. Currently we utilize a ferrule nut/compression fitting for attaching the brine line to the aspirator. We will be moving to a push-to-connect style fitting that simplifies the connection. On units that include an elbow out of the aspirator, the elbow is also a push-to-connect style.

This new push-to-connect fitting is backwards and forwards compatible and will work with all new and old models. The brine line is not changing and can accommodate both the old ferrule nut/compression fitting and the new push-to-connect design.

This design change will be implemented over the next few weeks and will be on every model water softener including all Dual Disk valves, 1" single disk valves and ¾" single disk valves.
